Introduction

VCM is a system that analyze vibration signal from Horizontal, Vertical and axial sensors installed in rotating machinery in powerplants

And give us some monitoring tools like time wave plot, trend plot, FFT plot, Shaft orbit, Bode plot, and etc. Vibration signals also fed to MLP neural network that analyze data and detects some machine faults such as Shaft unbalanc

Project History

1-System Started with a simple vibration analysis
In 2001 in AHWAZ Ramin Power Plant

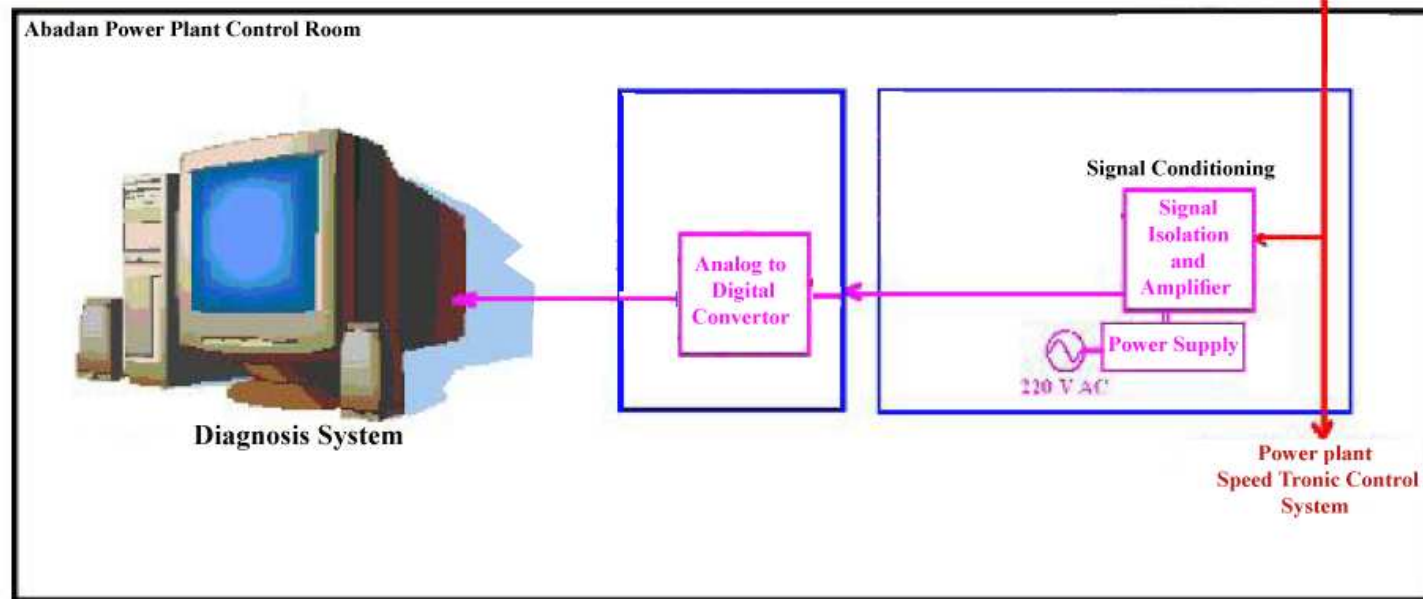

2- System is changed to online application in 2004
adding DAQ System in Niroo Research Institute

3- System is developed and added motors current
monitoring capability in 2007 and implemented in
Karaj Montazer Gaem Powerplan

4- Finally system is changed to web based version
And SMS-email alarming capabilities in 2012
